

ABSTRACT OF THE DISCLOSURE

A method and system for greatly reducing the amount of stop and go driving and shopping of a child caretaker that requires the transport of the child to and from a child activity center by providing kiosk units that allow for the purchase of child specialty products with the kiosk center being mounted directly in the storage space at the child activity center such as a hallway in a daycare center. The system allows for an attendant with lock and key and a merchant access device for credit cards to sell child specialty products conveniently and easily at the daycare center. The kiosk owner maintains the transport of goods, the shelves of which are labeled with each of the goods for sale and can be seen clearly through glass windows mounted on each of the doors including a refrigerator. A drive through kiosk can be provided selling child specialty products.
